In the low voltage (LV) distribution network, DC microgrid has been widely considered for its convenient and efficient absorption of new energy. With the multi-terminal access of photovoltaic, energy storage and other distributed energy sources, the fault characteristics of DC microgrid become more complex, which also puts

forward higher requirements for protection. Based on ...

LVDC microgrid is considered as the desired solution against the continuous increase of load demand which is powered by renewable energy sources (RESs) which upholds stability between energy needs ...

The primary concerns in designing and control of LVDC microgrid involve: (a) choice of suitable converter, (b) extraction of maximum power from RES, (c) voltage regulation and (d) power sharing among various sources and loads [7, 8]. The output power of PV is intermittent in nature and is affected due to change in climatic conditions.

LOW voltage DC (LVDC) microgrid has been widely valued as a promising technology of high-efficiency access to distributed energy resources (DERs) and DC loads, due to the absence of multistage conversions. An effective protection scheme is one of the key techniques of LVDC microgrids. The fault current capacity of semiconductor-based (such as ...

Due to increase in use of DERs, a need for LVDC microgrids is emerging. There is a need to reconsider employing DC distribution instead of AC distribution as many of the homes and office equipment like laptops, computers, mobile battery chargers, electronic lights etc., are DC powered. In this case

Designing protection for a DC microgrid is challenging due to its DC nature and heavily capacitor-dominated DC bus that induces high amplitude current spike during short-circuit faults. Moreover, for small-scale

applications such as residential DC microgrids, low line-resistance cables increase the fault detection time constraint.

Another fault location technique for an LVDC microgrid PPU is presented in [106]. Unlike the approach in [105], it uses an attenuation constant of the damped probe current response. Faults close to the PPU are detected with the help of external resistance and inductance, which corresponds to about 0.5 km length of the cable. The fault distance ...

Due to the required speed and reliability of LVDC microgrid protection, an increasing amount of research is focussing on local, measurement-based protection algorithms.

Short-circuit fault has a great impact on the safety of LVDC microgrids. In order to avoid damage to the DC equipment within microgrid, DC reactors need to be deployed to limit the fault current.
