Different types of energy storage systems: Battery storage. Batteries are electrochemical devices consisting of one or more cells having a positive terminal known as a cathode and a negative terminal known as an anode. They are the oldest, most popular, and generally accessible form of storage. A variety of chemistries are used in batteries.

The development of materials for electrochemical energy storage devices was reviewed in this review paper. Carbon-based materials are commonly utilised as electrode materials for energy storage because they offer the appropriate properties for storing energy, such as high conductivity, high discharge rate, and density.

For example, storage characteristics of electrochemical energy storage types, in terms of specific energy and specific power, are often presented in a "Ragone plot" [1], which helps identify the potentials of each storage type and contrast them for applications requiring varying energy storage capacities and on-demand energy extraction ...
