An Inductor is an important component used in many circuits as it has unique abilities. While it has a number of applications, its main purpose of being used in circuits is oppose and change in current. It does this using the energy that is built up within the inductor to slow down and oppose changing current levels.

The energy stored in the magnetic field of an inductor can be calculated as. $W = \frac{1}{2} L I^2$ (1) where . W = energy stored (joules, J) L = inductance (henrys, H) I = current (amps, A) Example - Energy Stored in an Inductor. The energy stored in an inductor with inductance 10 H with current 5 A can be calculated as. $W = \frac{1}{2} (10 \text{ H}) (5 \text{ A})^2$

Thus, the total magnetic energy, W_m which can be stored by an inductor within its field when an electric current, I flows through it is given as: Energy Stored in an Inductor. $W_m = \frac{1}{2} L I^2$ joules (J).
