Using the fluidity and self-healing characteristics of liquid metal, the close contact between lithium metal anode and solid state electrolyte at room temperature was realized. Subsequently, the ...

High safety gel polymer electrolyte (GPE) is used in lithium metal solid state batteries, which has the advantages of high energy density, wide temperature range, high safety, and is considered ...

These plateaus correspond to the formation of distinct alloy phases in accordance with the respective phase diagram of the binary Li|Bi and Li|Au systems. In the case of silver, no ...

The yellow and blue areas represent the electron depletion and accumulation, respectively. i) Phase diagram and j) free energy diagram of the ORR/OER reactions on Co (111)-NC plane, k) overpotentials of ORR/OER processes with ...

The Entity-Relationship Model (ER Model) is a conceptual model for designing a databases. This model represents the logical structure of a database, including entities, their attributes and relationships between them. Entity: An ...

o The capacity decay and resistance increase are bi-linear. o In the first phase the capacity decay is due to growth of Solid Electrolyte Interphase (SEI) which consumes active lithium. The ...

Accurate prediction of lithium-ion batteries" remaining useful life (RUL) is critical for system reliability and safety. This study proposes a novel forecasting framework that fuses modal ...

The precise synthesis of high-purity materials is crucial in accelerating materials discovery. However, the lack of theoretical understanding and practical guidance poses challenges, ...

If you have looked into the night sky, you may have noticed the Moon appears to change shape each night. Some nights, the Moon might look like a narrow crescent. Other nights, the Moon might look like a bright circle. ...

Anode-free Li metal batteries suffer from irreversible Li plating/stripping and interfacial side reactions. Here, authors propose a dual-gradient metal layer on Cu current collector to ...

However, when assembled into lithium metal batteries (LMBs), most iono-SPEs displayed limited cycling durations due to the much poorer lithium ions ( $\text{Li}^+$ ) transportation in polymer phase ...

Silicon is a promising anode material for next-generation lithium-ion batteries (LIBs) due to its high theoretical capacity. However, its practical use is hindered by significant volume expansion ...

Phase equilibria and the solubility of components in the system lithium chloride + water + triethylamine (TEA) were studied in the range 293.15-363.15 K by the visual polythermal ...

The shorter  $\tau_a$  observed in the bulk phase compared to the surface phase suggest that the migration energy barriers for the atoms in the bulk are lower. This, in turn, results in higher self ...

In the inverse problem, i.e. determining OCV of lithium iron phosphate (LFP) cathode from phase diagram constrained by thermochemical and electrochemical data, we demonstrate accurate ...

The density and thermal expansion coefficients of the  $\text{Li}_2\text{Ca}$  intermetallic alloy were measured in the temperature range of 284 - 906 K for the solid and liquid states by gamma-ray attenuation ...

Combining the estimated lithium contents calculated from the final products ( $\text{Li}_2\text{Ga}$  and  $\text{Li}_{13}\text{In}_3$ ), which are consistent with the phase diagram results in Fig. S16, at the fully discharged ...
