One of the most promising candidates is lithium-sulfur (Li-S) batteries, which have great potential for addressing these issues. [5-7] The conversion reaction based on the reduction of sulfur to lithium sulfides (Li_2S) yields a high ...

Li-metal and elemental sulfur possess theoretical charge capacities of, respectively, 3,861 and 1,672 mA h g⁻¹ [1]. At an average discharge potential of 2.1 V, the Li-S battery presents a theoretical electrode-level specific energy of ~2,500 W h kg⁻¹, an order-of-magnitude higher than what is achieved in lithium-ion batteries. In practice, Li-S batteries are ...

There has been steady interest in the potential of lithium sulfur (Li-S) battery technology since its first description in the late 1960s [1]. While Li-ion batteries (LIBs) have seen worldwide deployment due to their high power density and stable cycling behaviour, gradual improvements have been made in Li-S technology that make it a competitor technology in ...
