A traditional lead-acid cell-- the battery most often used in heavy-duty power applications-- stores energy at a density of 30-40 watt-hours per kilogram: enough to power a 100-watt bulb for about 20 minutes. A flywheel-based battery, on the other hand, can reach energy densities 3-4 times higher, at around 100-130 watt-hours per kilogram.

Building and maintaining New Zealand's homes and buildings; Response to Canterbury earthquakes; Response to the rapid building assessment system review; ... The NZ Battery Project was established in late 2020 to find innovative solutions to the "dry year problem", when hydro-electricity lakes run low, leading to the burning of more fossil ...
