In an ESS system with an MPPT the charger of the inverter/charger is disabled. This is because the MPPT charges the battery and excess solar power is being fed back into the grid. This process is controlled by the CCGX. To make this work, the CCGX will set the MPPT at a higher DC voltage than the inverter/charger's DC voltage.

the good method would be to mimic solar panels using a DC/DC converter. So if your battery is 24V, you can probably increase to 36 or 48V. Additionally the current inrush would be limited by the converter. another way would be to add an all-in-one MPPT after the grid tie, so the battery will go thru the inverter of the MPPT.
