

## Non-critical loads

Adaptive current sharing: Automatically adjusts charger output based on alternator performance  
Priority shedding: Temporarily disconnects non-critical loads during high-demand periods ...

As the ES devices aim to stabilize voltage by dynamically adjusting power to non-critical loads, they maintain a steady supply for critical loads. The initial voltage profile exhibits fluctuations, ...

MCB changeover switches automatically maintain continuous power supply by instantly switching between your main electrical grid and backup power sources like generators or UPS systems ...

$I_{max}$  and  $I_n$  ratings are the two most critical current specifications for Surge Protection Devices (SPDs), with  $I_{max}$  representing maximum discharge current capacity (typically 20-160 kA) and ...

Choosing the right surge protection device (SPD) configuration is critical for protecting electrical systems from voltage surges and lightning strikes. The four main types--1P, 1+NPE, 3P, and ...

Learn how MCB changeover switches work to ensure continuous power during outages. Discover their types, applications, and installation guidelines in this comprehensive technical guide.
