IEC 61850 is an international standard for the design of electrical substation automation that facilitates interoperability and communication among devices in substations and other elements of the smart grid. This standard enhances the integration of various components, ensuring efficient data exchange and control, which is essential for modern power systems and smart grid ...

IEC 61850 was launched in 2003 as a standard for digital substations and it is widely used in such applications. In principle, however, the Smart Grid is just a regionally distributed system of electrical substations, so IEC 61850 is also very relevant to the Smart Grid and, in fact, the IEC has designated it as one of the core smart grid standards.

IEC 61850 is responsible for the growing utilization of digital substations and digital applications in conventional substations. ... (IEDs) have ever increasing applications for the building of today's smart grid. Electric power substations will play a major role in the Smart Grid. IEC 61850 is a family of standards that defines network protocols, and data and device naming conventions for electric substation automation. IEC 61850 provides utilities with the ability to better monitor operation and even remotely control the substation when necessary.

IEC 61850 assures backward and forward compatibility and solution flexibility and durability by enforcing
