This study defines remote microgrid as a grid that operates in remote areas and can function in either on-grid or islanded mode [26]. The primary objective of an remote microgrid is to provide electricity to prosumers in isolated areas; this type of system may face challenges such as disturbances to the main grid, high main-grid electricity ...

Grid-forming converters not only provide voltage and frequency support for remote islanded microgrids but also induce increasing instability risks during disturbances caused by typhoons, rainstorms, etc. With the assistance of LEO satellite internet, a data-driven predictive control (DPC) strategy is proposed to enhance the stability and resilience of remote islanded ...

The microgrid is connected to the main power system through the point of common coupling (PCC). However, the remote location of the microgrid--outside the expandable areas of the power network--makes the only line connection to the main grid prone to failures that cause supply interruptions, lasting from a few hours up to several days.
